Re: Proposal for Strategic Partnership – Next-Generation Coordinate Measuring Solutions

Dear Ms. Walker,

Thank you for the productive conversation we shared at the Midwest Precision Manufacturing Forum last month. Following our discussion regarding Axon Precision Engineering's expansion into the aerospace component sector, I am writing to formally introduce a partnership opportunity that I believe will directly support the tolerance and throughput goals you outlined for the coming fiscal year.

Helvern Metrology Systems has, for over twenty-three years, supplied advanced coordinate measuring machines, optical scanners, and traceable calibration services to mid-market precision manufacturers across North America. Our engineering team has worked closely with several firms in your tier of the supply chain, including two of the contractors named in your most recent investor briefing, and we have developed a deep familiarity with the inspection challenges that accompany sub-five-micron tolerances on complex geometries. I would welcome the opportunity to bring that experience to bear on the work underway at your Brentwood Park facility.

Specifically, I would like to propose a three-part engagement designed to be deployed over the next twelve to eighteen months. The first phase would involve an on-site assessment of your current metrology footprint, including the legacy CMM units in Cell 4 and the manual gauging stations supporting your turbine housing line. Our application engineers would document cycle times, fixture utilization, and operator handling steps, then deliver a written report identifying measurable opportunities for consolidation. This assessment is offered at no cost and carries no obligation to proceed further.

The second phase, contingent upon the findings of the assessment, would involve a structured pilot deployment of our HVN-7400 series bridge-type CMM alongside a HelvernScan optical profilometer. Based on benchmarks from comparable installations, we project a reduction in dimensional inspection time of between thirty-eight and forty-six percent on first-article runs, with corresponding gains in throughput on production batches above one hundred units. The pilot would run for ninety days under a

shared performance agreement, with documented acceptance criteria agreed upon in advance by both parties.

The third phase would establish Helvern as a preferred metrology partner for Axon Precision Engineering, encompassing scheduled calibration, software updates, and priority technical support. Under the terms we have offered comparable partners, Axon would receive guaranteed twenty-four-hour response on critical service requests, quarterly on-site reviews from a dedicated account engineer, and access to our training facility in Cleveland for up to six of your operators per calendar year at no additional charge.

I recognize that any decision of this magnitude requires careful evaluation, particularly given the capital planning cycles common in your industry. To that end, I have enclosed a detailed capability brochure, three case studies from recent comparable engagements, and a summary of the financial structures we have offered to similar partners. None of these materials commit Axon to any course of action; they are intended only to support an informed internal conversation.

I would be grateful for the opportunity to visit your facility at your convenience to discuss this proposal in greater depth. I will be in the greater Detroit area during the weeks of May 18 and June 8 and would gladly arrange my schedule around yours. Should those windows prove inconvenient, I am happy to coordinate a video call or to host you and members of your team at our application center in Sheffield Heights, where you would be able to evaluate the proposed equipment under conditions approximating your own production environment.

Please feel free to contact me directly at the number listed below or by email at m.halloway@helvernmetrology.example. My assistant, Daniela Reinhart, can also be reached at extension 214 to coordinate scheduling. Thank you again for your time, and I look forward to the possibility of working together to support the next chapter of Axon's growth.

Sincerely,

Marcus T. Halloway
